Drip Irrigation | Light continuous labyrinth drip line

eXXtreme Tape[®] - irritecTape[™]

The light continuous labyrinth drip line is ideal for closely spaced planting patterns, and well-drained, sandy soils due to the presence of drip points with narrow spacing. It is the result of a single extrusion process, which avoids issues with bonding. The double green line identifies the side of the outlet holes to correctly lay the tape.

Features and advantages:

- The laser-cut outlet reduces the ingress of solid particles
- Excellent resistance to peaks in pressure, even with minimal thicknesses
- Excellent tensile strength
- The particular design of the labyrinth allows maximum uniformity over extended lengths
- Excellent levels of performance in terms of uniformity, even during fertigation cycles
- Reduction of phytopathological issues as a result of keeping the leaf system dry
- Ideal for closely spaced planting patterns, and well-drained, sandy soils due to the presence of drip points with narrow spacing
- Excellent filtration capacity: this increases the range of fertilisers that can be used, including water-soluble fertilisers
- Complies with ISO 9261 standards
- Resistant to UV light and commonly used fertilisers

TWO VERSIONS ARE AVAILABLE:

IDEAL FOR USE WITH
DIRTY WATER

Drip Irrigation | Light dripline with continuous labyrinth and double continuous inlet filter

eXXtreme Tape®

PATENTED

eXXtreme Tape®, has a **double continuous inlet filter** with a length equal to twice the length of the tube. Designed using an **exclusive Irritec® patented system**, it guarantees excellent filtering performance even when using "difficult" to filter water which is laden with sediments, mud and dirt, thanks to the continuous double filter present along the entire length of the drip line.

Features and advantages

- The double continuous filter allows excellent uniformity during emission and wetting, even when the water contains a significant quantity of solid particles.
- Ideal for closely spaced planting patterns, and well-drained, sandy soils due to the presence of drip points with narrow spacing.
- It is the result of a single extrusion process, which avoids issues with bonding.
- Excellent tensile strength.
- The laser-cut outlet reduces the ingress of solid particles.
- Excellent resistance to peaks in pressure, even with minimal thicknesses.
- The particular design of the labyrinth allows maximum uniformity over extended lengths.
- Excellent filtration capacity: this increases the range of fertilisers that can be used, including water-soluble fertilisers.
- The double green line identifies the side of the outlet holes to correctly lay the tape.
- Reduction of phytopathological issues as a result of keeping the leaf system dry.

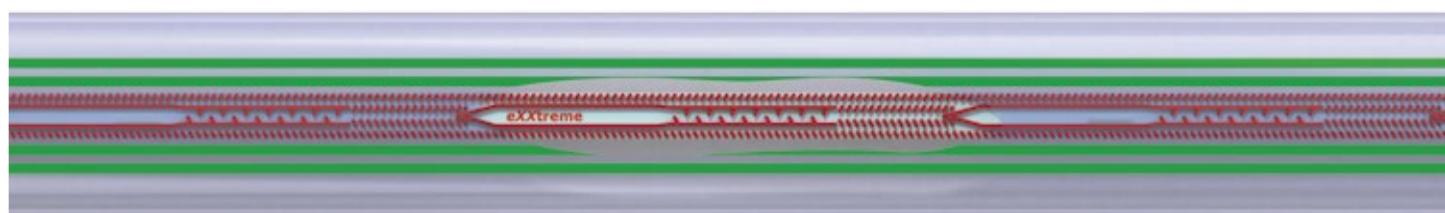

Flow rate in LPH/metre, according to spacing and the operating pressure

Flow rate LPH	Operating in bar	Spacing (cm)					
		7.5	10	15	20	30	40
0.60	0.55	-	5.40	3.60	2.70	1.80	1.40
	0.70	-	6.00	4.00	3.00	2.00	1.50
0.90	0.55	10.60	8.00	5.30	4.00	2.70	2.00
	0.70	12.00	9.00	6.00	4.50	3.00	2.30
1.20	0.55	14.2	10.70	7.10	5.30	3.50	2.70
	0.70	16.0	12.00	8.00	6.00	4.00	3.00

*eXXtreme Tape with a spacing of 10 cm and a flow rate of 0.60 LPH requires a 155 mesh filter.

Drip Irrigation | Continuous labyrinth drip line

IrritecTape™

irritecTape™ is a product that has been tried and tested over many years and whose outstanding performance makes it one of the best performing drip lines. The lightweight continuous-labyrinth drip line is **ideal in cases of low spacing** for application in open field horticultural and floricultural crops. The small distance between the drip points and the low flow rate make it **perfect for very sandy soils**.

Features and advantages:

- Excellent resistance to peaks in pressure, even with minimal thicknesses
- Excellent tensile strength
- The particular design of the labyrinth allows maximum uniformity over extended lengths
- Excellent levels of performance in terms of uniformity, even during fertigation cycles
- Compared to other products, it is the result of a single extrusion process, which avoids issues with bonding.

Drip Irrigation | Light drip line with flat dripper

P0™ - P1® - P5™

The light drip line with flat dripper allows seasonal and multi-seasonal use thanks to the wide range of thicknesses and flow rates available. The flat dripper guarantees extremely low localised head losses, with the possibility of achieving high line lengths for each of the many available diameters.

Features and advantages:

- The wide range of available thicknesses means that it has good abrasion resistance and can be used for multiple years in the presence of soil insects
- The special design of the labyrinth reduces sensitivity to pressure and increases the self-cleaning effect due to the higher degree of turbulence that is developed
- Ability to create drip lines of significantly greater length for each of the many available diameters
- Excellent uniformity and the ability to combine the low flow rates of drippers with very large diameters (up to 29 mm) makes it possible to lay the tube over very long distances.
- The integrated filter prevents clogging
- The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water
- The presence of the special internal Flap system means it can be used in subirrigation
- In addition to open field horticultural crops, the wide range of available spacings means it can also be used for orchards, or emergency and root irrigation.
- Complies with ISO 9261 standards
- Resistant to UV light and commonly used fertilisers

Drip Irrigation | Light drip line with ultra-compact dripper

PO™

IDEAL FOR NARROW SPACING

LIGHT DRIP LINE WITH FLAT ULTRA-COMPACT HIGH PERFORMANCE Dripper

PO™ is the brand new Irritec® light drip line, realised with the extremely small and innovative, flat moulded dripper that generates imperceptible head losses, ideal for narrow spacing and long length lines. The compact and efficient dripper makes PO™ ideal for single-season crops with narrow spacing.

Features and advantages:

- Dripline manufactured using only top-quality virgin raw materials.
- Dripper developed and manufactured with the most modern and advanced technologies.
- Inlet filter with 3D development that significantly increases the filtering surface area of the dripper.
- Large filtering surface area in comparison to the small surface area of the dripper itself.
- High-performance turbulent labyrinth with wide passage cross-sections enables very low flow exponents to be achieved.
- The turbulence developed inside the labyrinth prevents the accumulation of sedimentation and reduces the risk of clogging.
- Coefficient of variation (CV) among the lowest on the market.
- Drippers bonded to the inner wall of the co-extruded drip line.
- Complies with ISO 9261 standards.
- Resistant to UV light and commonly used fertilisers.
- Precision and efficiency alternative for single-season crops with spacings from 10 cm.

Drip Irrigation | Light drip line with flat dripper

P1[®]

THE HISTORIC IRRITEC[®] drip line

The light drip line with flat dripper P1[®] is a "historic" product, synonymous with reliability, excellent performance, strength and versatility. Known across the world for its excellent characteristics, P1[®] is ideal for situations where the spacing is greater than 20 cm. The flat drip head guarantees extremely low, localised head losses, resulting in the uniformity of emission along the entire length of the drip line, and with the same uniformity, allows longer lateral lines to be laid out.

Features and advantages

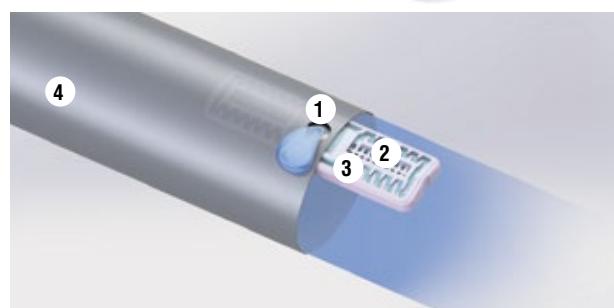

- Lightweight drip lines are the ideal solution when spacing is greater than 20 cm.
- The wide range of available thicknesses and flow rates allows for seasonal and multi-seasonal use, even in the presence of stones and soil insects.
- The special design of the labyrinth reduces the sensitivity to pressure and increases the self-cleaning effect due to the higher degree of turbulence that is developed.
- The flat drip head guarantees extremely low, localised head losses, resulting in the uniformity of emission along the entire length of the drip line.
- Excellent uniformity and the ability to combine the low flow rates of drippers with very large diameters (up to 29 mm) makes it possible to lay the tube over very long distances.
- The integrated filter prevents clogging.
- The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water.
- The presence of the special internal Flap system means it can be used in subirrigation.

Flow rates available

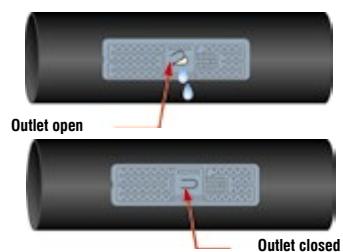

Protected outlet

The protected outlet system, fine-tuned by the research and development office at Irritec® allows the P1™ to be buried in the soil, eliminating issues with the aspiration of mud and debris, and minimising the possibility of root intrusion. The system operates by means of a "flap" achieved by the special machining of the emission hole. During the irrigation cycle the flap lifts up and guarantees a steady outflow of water and, at the end of the irrigation cycle, the flap returns to its standby position, closing the emission hole and, therefore, prevents any infiltration of mud and debris.

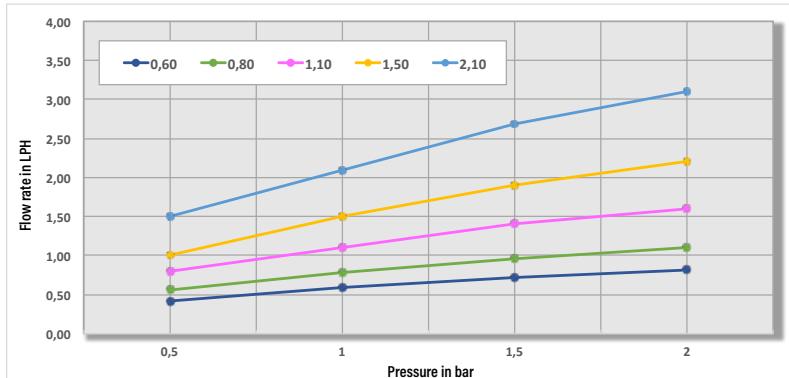

P1 available in 6-8 mil and P1 ULTRA available 10-12 and 15 mil, with flow rates of 0.6-0.80-

1.10-1.50-2.10

Drip Irrigation | Light drip line with long labyrinth flat dripper

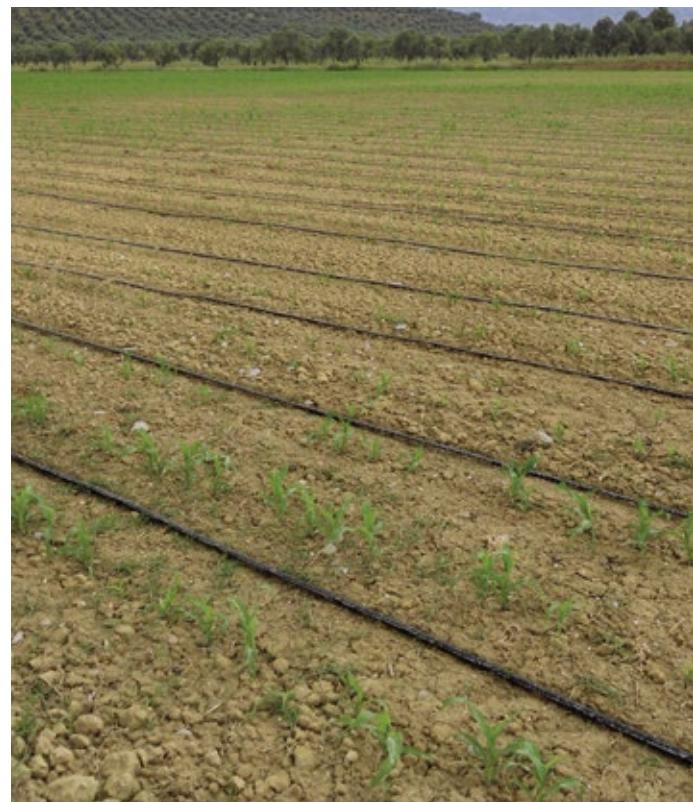

P5™

LONGER,
LARGER AND STRONGER LABYRINTH
PATH!

P5™ is the light drip line with a long labyrinth flat dripper that is both larger and more resistant to clogging. The larger cross-section of the labyrinth means it is ideal for difficult-to-filter waters. It is particularly recommended when large volumes of water need to be delivered quickly and where spacing of more than 60 cm is required.

Features and advantages

- Retains all the excellent characteristics of the drip line P1®.
- The long labyrinth guarantees high performance in terms of uniformity of emission.
- The larger cross-section of the labyrinth therefore makes it ideal with difficult to filter waters.
- It also offers a wide range of spacing over 60 cm, and is suitable for high flow rates and where large volumes of water need to be delivered quickly.
- In addition to open field horticultural crops, the wide range of available spacings means it can also be used for orchards, or emergency and root irrigation.
- The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water
- Excellent uniformity of emission and the ability to combine the low flow rates of drippers with very large diameters (up to 29 mm) makes it possible to extend the lateral lines over very long distances.
- The special design of the labyrinth reduces sensitivity to pressure and increases the self-cleaning effect due to the higher degree of turbulence that is developed.

2.10 LPH - SKY BLUE

2.80 LPH - BROWN

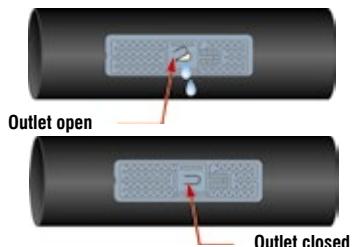

3.80 LPH - BEIGE

Protected outlet

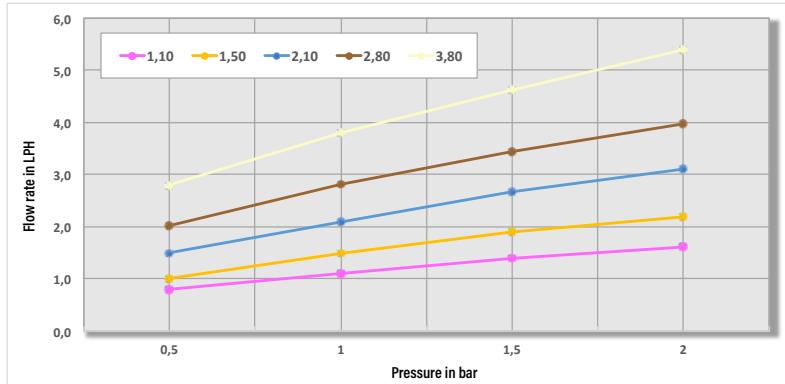

The protected outlet system, fine-tuned by the research and development office at Irritec®, allows the P5 to be buried in the soil, eliminating issues with the aspiration of mud and debris, and minimising the possibility of root intrusion. The system operates by means of a "flap" achieved by the special machining of the emission hole. During the irrigation cycle the flap lifts up and guarantees a steady outflow of water and, at the end of the irrigation cycle, the flap returns to its standby position, closing the emission hole and, therefore, prevents any infiltration of mud and debris.

P5 available in 6-8 mil and P5 ULTRA in 10 - 12 and 15 mil, with flow rates of 1.10-1.50-2.10-2.80-3.80

Drip Irrigation | Classic drip line with flat dripper

M5™ - M7™

The classic drip line with flat dripper is ideal for orchards and perfect for multiannual crops. Available with a compact drip head, with lower head loss benefiting uniformity and maximum lengths, or a larger drip head with a long labyrinth path allowing better pressure control.

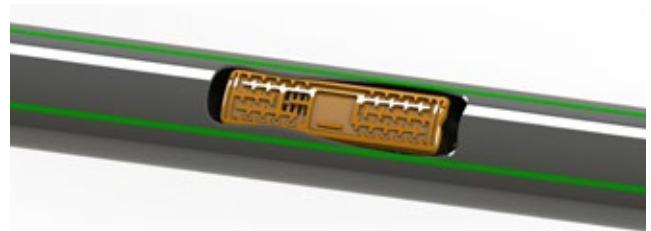

Features and advantages:

- Ideal for orchards and perfect for multiannual crops
- The special design of the flat dripper allows for excellent emission uniformity
- The special design of the labyrinth reduces sensitivity to pressure and increases the self-cleaning effect due to the higher degree of turbulence that is developed
- The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water
- Reduced sensitivity of the flow rate when the pressure changes

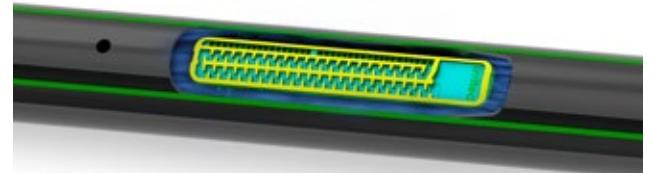

Available product type

Example of a dripper

Field of application

Drip Irrigation | Classic drip line with flat dripper

D5™ - D7™

The classic drip line with flat **dripper D5™** and **D7™** is ideal for orchards and use with multiannual crops. The special design of the flat dripper allows optimal uniformity while the special design of the labyrinth reduces sensitivity to pressure and increases the self-cleaning effect due to the higher degree of turbulence that is developed. The **D5™** model has the same dimensions as the classic drip line but is packaged in a cardboard reel.

Features and advantages

- The heavy drip line has minimal localised head loss as a result of the special design of the dripper.
- The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water
- Excellent uniformity of emission and the ability to combine the low flow rates of drippers with very large diameters (up to 29 mm) makes it possible to extend the lateral lines over very long distances.
- D5 is produced in rolls.
- M5 is produced in reels.

Drip Irrigation | Classic drip line with flat dripper

D7™

LASTS THE ENTIRE DURATION OF THE CROP!

The long labyrinth flat dripper version D7™, as a result of the large size of the innovative flat dripper, has an extensive filtering surface area, which, combined with the turbulent labyrinth with wide passage cross-sections, makes it ideal for water that is heavily laden with solid particles. High filtration capacity.

Features and advantages

- Ideal for orchards. Perfect for multiannual crops with very long lateral lines.
- The innovative, medium-sized flat dripper has a large filtering surface area, and can be used with water that is heavily laden with solid particles as a result of the turbulent labyrinth with wide passage cross-sections. This guarantees a compact form and ensures maximum uniformity even when very long lateral lines need to be laid.
- Classic DRIP LINE with flat dripper
- Excellent uniformity of emission and the ability to combine the low flow rates of drippers with very large diameters (up to 25 mm) makes it possible to extend the lateral lines over very long distances.
- The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water
- The long path of the labyrinth allows better pressure control.
- Reduced sensitivity of the flow rate when the pressure changes.

Drip Irrigation | Classic drip line with cylindrical dripper

Tandem® - Junior®

CLASSIC DRIP LINE WITH CYLINDRICAL DRIPPER

The classic drip line with cylindrical dripper is characterised by an outlet with four opposing emission holes that prevent the aspiration of impurities and simplify the installation. The dripper, equipped with an inlet filter, significantly reduces the risk of clogging caused by using poor quality water; The outlet holes of the dripper allow quick and easy installation without the need to check the position of the emission point, ensuring the tube is emptied at the end of the irrigation cycle.

Drip Irrigation | Classic drip line with cylindrical dripper

Tandem[®]

Tandem[®] is the classic Irritec drip line with cylindrical dripper. The drip head with double perforation makes it possible to increase the surface area to be irrigated. Its four emission holes, positioned opposite to one another prevent the aspiration of impurities, make it easier to install.

- The turbulent flow dripper (self-cleaning) prevents the accumulation of sediment inside the labyrinth;
- The dripper, equipped with an inlet filter, greatly reduces the risk of clogging caused by using poor quality water;
- The outlet holes of the dripper allow quick and easy installation without the need to check the position of the emission point and ensure the pipework is emptied at the end of the irrigation cycle.
- Larger irrigated surface area with reduction in percolation;
- Ability to install lines with wider spacing but with the same yield in terms of flow rate and irrigated area, and with the possibility of installing longer lines

Drip Irrigation | Classic drip line with cylindrical dripper

Junior[®]

Junior[®] is the standard integrated drip line with smaller emitters than the Tandem[®]. This results in minimal head losses, allowing the installation of drip lines of significant lengths. The dripper regulates the flow rate, ensuring optimum uniformity during irrigation.

Features and advantages

- Reduced head loss as a result of the compactness of the dripper
- Retains all the technical features of the tandem dripper
- Also available in the 35 mil version
- Drip line with four emission holes positioned opposite to one another (applies to all cylindrical models) which prevent the aspiration of impurities, making it easier to install.
- The outlet holes of the dripper allow quick and easy installation without the need to check the position of the emission point, ensuring the tube is emptied at the end of the irrigation cycle.

Drip Irrigation | Classic drip line with pressure compensating cylindrical dripper

Multibar™

The classic drip line with a pressure compensating cylindrical dripper is the ideal solution for irrigating multi-season crops and is also suitable for sloping terrain and uneven topography. The special design of the dripper allows efficient pressure compensation within a very wide range.

Features and advantages:

- The pressure compensating system of the dripper is ensured by a silicone membrane that maintains a constant flow rate when the operating pressure changes.
- Suitable for sloping terrain and uneven topography.
- The special design of the dripper allows efficient pressure compensation within a very wide range.
- Perfect fertiliser dosing at any part of the plant.
- Line lengths in excess of 800 metres can be realised.
- The Drop Stop model is characterised by the special design of the dripper that stops the flow at the end of the irrigation cycle, making it particularly suitable for crops that require short irrigation cycles.
- The version with the Anti-Siphon System prevents the aspiration of impurities.

Drip Irrigation | Classic drip line with pressure compensating cylindrical dripper

Multibar™ C

Multibar™ C is the classic drip line with a pressure compensating cylindrical dripper, ideal for installations in areas with significant changes in ground level, where increased line lengths, constant flow rates in every section of the system and high precision emissions are required.

Features and advantages

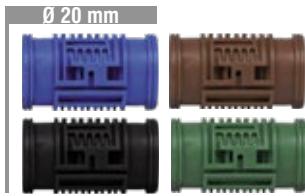

- Ideal for irrigating multi-season crops.
- The pressure compensating system of the dripper is ensured by a silicone membrane that maintains a constant flow rate when the operating pressure changes.
- Suitable for sloping terrains and uneven topography.
- The special design of the dripper allows efficient pressure compensation within a very wide range.
- Perfect fertiliser dosing at any part of the plant.
- Drip line with two emission holes positioned opposite to one another (applies to all cylindrical models) which prevent the aspiration of impurities, making it easier to install.
- Line lengths in excess of 800 metres can be realised.

Drip Irrigation | Classic drip line with pressure compensating cylindrical dripper Anti-siphon and Drop Stop

Multibar™ C a.s. - d.s.

Multibar™ C The anti-siphon and drop stop version is ideal for installation in areas with significant changes in ground level. The ant-drainage Irritec Drop Stop System of the Multibar drippers ensures high precision during irrigation cycles, providing all the drippers on the line with simultaneous opening and closing. This allows for a more uniform harvest at the end of the irrigation cycle. The anti-siphon system also prevents the ingress of dirt into the dripper when the tube is emptied.

Features and advantages

- Retaining all the excellent features of the Multibar C, it is characterised by the special design of the dripper that stops the flow at the end of the irrigation cycle, making it particularly suitable for crops that require short irrigation cycles.
- The anti-siphon system prevents the aspiration of impurities.
- Drip line with two emission holes positioned opposite to one another (applies to all cylindrical models) which prevent the aspiration of impurities, making it easier to install.
- The pressure compensating system of the dripper is ensured by a silicone membrane that maintains a constant flow rate when the operating pressure changes.

Drip Irrigation | Classic drip line with pressure compensating flat dripper

Multibar™ F

WITH FLAT DRIPPER

The classic drip line with pressure compensating flat dripper guarantees steady performance as a result of its special design, even when the temperature conditions change during open field use. The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water.

Features and advantages:

- The special design of the dripper guarantees steady performance even in extreme temperature conditions (as thermal conditions change during use in the open field).
- The particular positioning of the filter, which faces towards the centre of the tube, allows the water to enter the labyrinth free from areas of standing water
- The Drop Stop model is characterised by the special design of the dripper that stops the flow at the end of the irrigation cycle, making it particularly suitable for crops that require short irrigation cycles.
- The model with the Anti-Siphon System prevents the aspiration of impurities.
- The wide opening and closing range further enhances the drop stop effect, thereby increasing the possibility of application, even on steep slopes.
- Maximum precision in water distribution in any topographical situation.
- Complies with ISO 9261 standards.
- Resistant to UV light and commonly used fertilisers.

Drip Irrigation | Classic drip line with pressure compensating flat dripper

Multibar™ F

Multibar™ F is the classic drip line with a flat pressure compensating dripper which guarantees high uniformity of water and nutrient emission when the pressure changes. The very high precision in distribution in any topographical situation is guaranteed by the regulation of the flow rate provided by the silicone membrane in the dripper.

Features and advantages

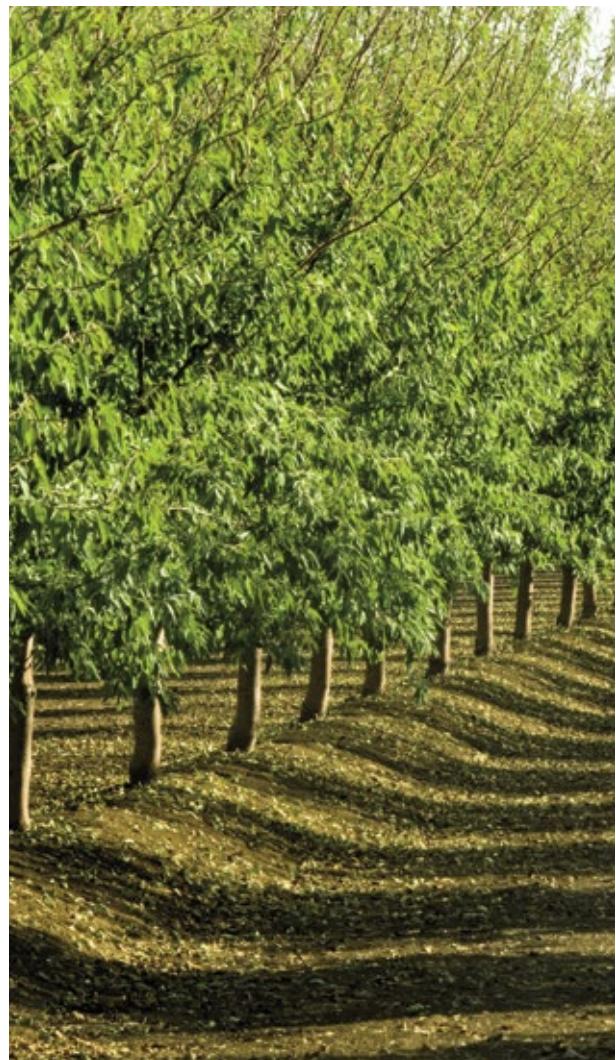

- The flat dripper with turbulent flow labyrinth is self-cleaning during normal operation. Respect the recommended filtration types.
- The position of the integrated filter, which faces towards the centre of the tube, away from the water accumulation zones, allows clean water to enter the labyrinth
- Low manufacturing coefficients of variation
- High uniformity during emission.
- Multiseason use.

Drip Irrigation | Classic drip line with pressure compensating flat dripper

Multibar™ F a.s.

Multibar F™ AS is the classic drip line with flat PC (pressure compensating) and Anti-siphon dripper, which maintains a constant flow rate when the pressure changes, due to the characteristics of the dripper and the internal silicone membrane. It guarantees a high level of emission uniformity, water and nutrients, all combined with maximum precision in the distribution of emission in any topographical situation. The anti-siphon system prevents the aspiration of impurities and soil particles into the dripper.

Features and advantages

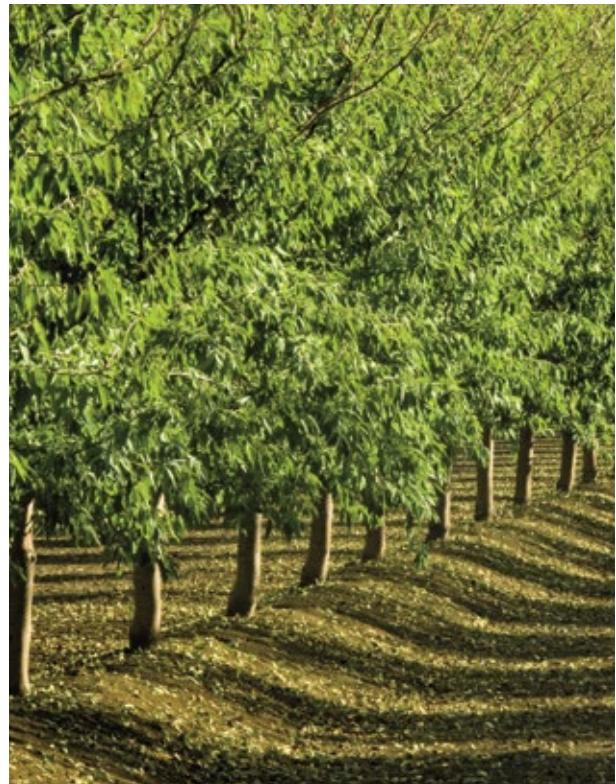

- Particularly suitable for subirrigation and sloping terrain, therefore it avoids inducing water stress on the roots
- The flat dripper with turbulent flow labyrinth is self-cleaning during normal operation. Respect the recommended filtration types.
- The position of the integrated filter, which faces towards the centre of the tube, away from the water accumulation zones, allows clean water to enter the labyrinth.
- Low manufacturing coefficients of variation
- High uniformity during emission
- Multiseason use.

Drip Irrigation | Classic drip line with pressure compensating flat dripper

Multibar™ F a.s. - d.s.

CLASSIC DRIP LINE WITH FLAT PRESSURE COMPENSATING, ANTI-SIPHON AND DROP STOP DRIPPER

Multibar® F AS and DS is the classic drip line with flat PC Anti-siphon and Drop Stop dripper, which maintains a constant flow rate when the pressure changes due to the characteristics of the dripper and the internal silicone membrane. It guarantees a high level of emission uniformity, water and nutrients, with maximum precision in the distribution of emission in any topographical situation, as a result of its wide field of application.

The anti-siphon system prevents the aspiration of impurities and soil particles into the dripper.

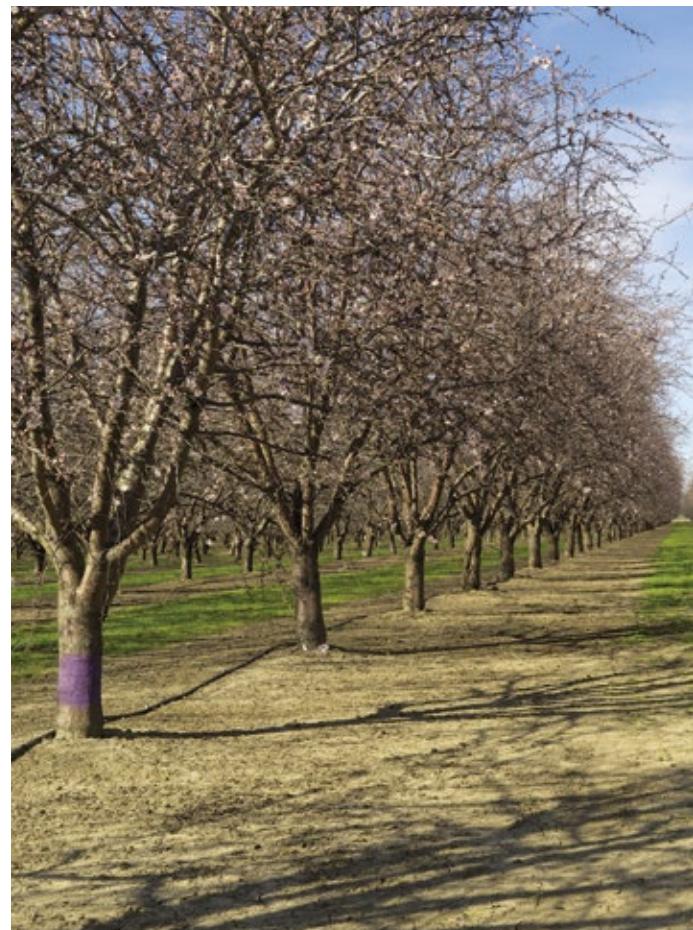

The anti-drainage, Drop Stop system prevents the line from emptying at the end of each cycle by equalising the emission times and quantities for each plant. The synchronised opening and closing of each irrigation cycle improves the uniformity of plant growth, promoting a better harvest.

Features and advantages

- Particularly suitable for subirrigation and sloping terrain, avoiding water stress on the roots
- The flat dripper with turbulent flow labyrinth develops self-cleaning of the passages during normal operation. Respect the recommended filtration types.
- The position of the integrated filter, which faces towards the centre of the tube, away from the water accumulation zones, allows clean water to enter the labyrinth.
- Low manufacturing coefficients of variation.
- High uniformity during emission.
- Multiseason use.

Drip Irrigation | Classic drip line with small diameter cylindrical dripper

Minidrip[®]

The classic Minidrip drip line[®] is ideal for watering gardens, flowerbeds and small vegetable gardens, thanks to its low cost, aesthetic impact and the excellent watering characteristics of the turbulent flow labyrinth dripper, as well as the double inlet filter which reduces the accumulation of sediment and the risk of clogging.

Features and advantages

- Small dripper (7 mm in diameter).
- Dripper with turbulent flow labyrinth and double inlet filter guarantees a lower accumulation of sediment, thereby reducing the risk of clogging.
- Ideal drip line for gardens.

Product available in:

- reels:
 - of 1,200 m for 15 cm spacings
 - of 1,300 m for 20 cm spacings
 - of 1,500 m for 30 cm spacings
- boxes: containing 4 x 15 m reels

Drip Irrigation | Classic pressure compensating drip line for subirrigation

Multibar™ C Rootguard

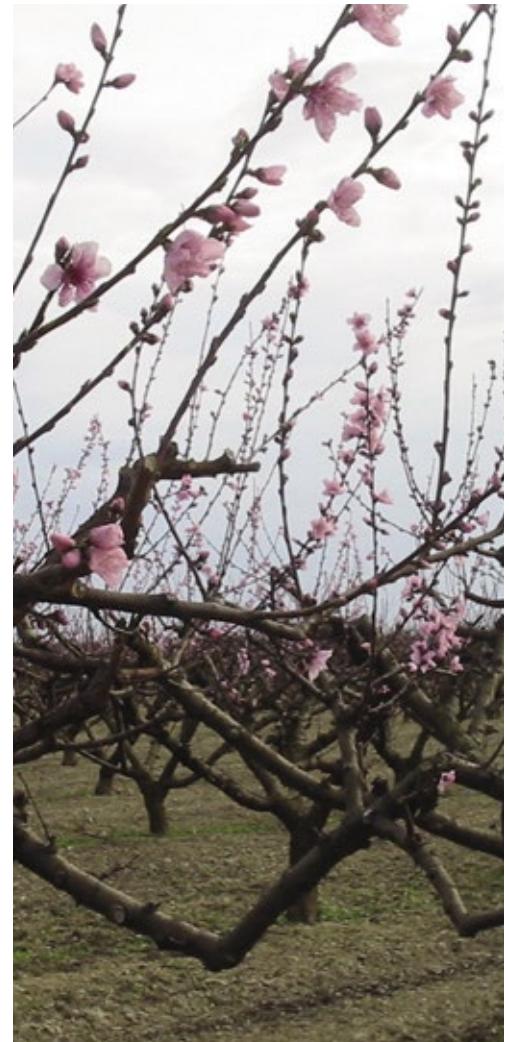

PRESSURE COMPENSATING DRIP LINE FOR SUBIRRIGATION

Multibar™ C Rootguard™ is the ideal drip line for subirrigation installations ensuring high precision emission during irrigation cycles.

The Rootguard™ system allows the drip line to be buried and withstand the test of time without suffering problems of root intrusion.

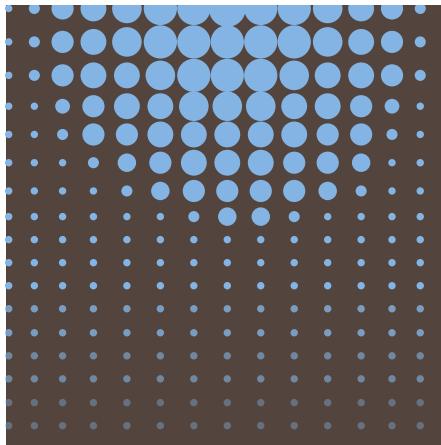

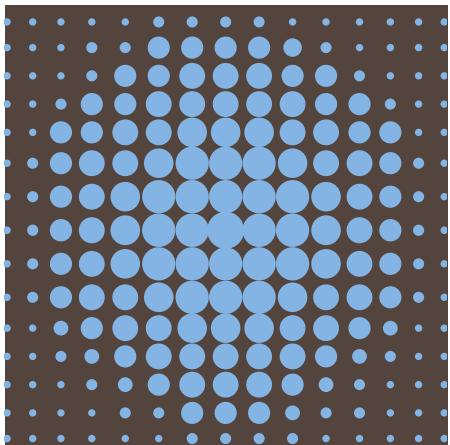

Features and advantages

- Retains the excellent features of the traditional Multibar™ C.
- The pressure compensating system of the dripper is ensured by the sophisticated design and the silicone membrane that maintains a constant flow rate even when the operating pressure changes.
- Allows greater lengths, ensuring a high emission uniformity.
- It allows the precise distribution of water and nutrients directly at the root zone of the plants, optimising and therefore reducing the consumption of water and the products used, resulting in reduced costs and environmental impact.
- Ideal for burying, it is resistant to clogging and ensures constant emission uniformity throughout the service life of the product.
- Complies with ISO 9261 standards.
- Resistant to UV light and commonly used fertilisers.

Subirrigation

Surface irrigation

Distribution of water after 10 hours with 1 hour of irrigation

For the same amount of water emitted, drip irrigation increases the volume of wetted soil by 46% compared to surface irrigation.

This decreases the saturation point of the soil, which not only leaves more space for increased aeration, but also promotes the capillary movement of water and reduces water loss through percolation.

Field of application

Drip Irrigation | Classic pressure compensating drip line for subirrigation

Why subirrigation

- Higher yield. Water and nutrients distributed directly to the root system promote healthy plant growth and reduce stress.
- Better crop quality. Both soil and foliage are kept dry, reducing fungal diseases which are promoted by overhead irrigation and eliminating fruit and leaf spots often caused by irrigation from above the foliage.
- Safe and efficient distribution of fertilisers and insecticides. The chemical products go directly to the root system, reducing the amount needed and minimising environmental pollution.
- Fewer weeds. The dry soil surface inhibits the growth of weeds.
- Improved soil aeration. Smaller soil particles are not washed away, thereby reducing soil compaction and promoting root growth.
- Dry soil surface. With a dry soil surface, the tending and harvesting of crops can be carried out while irrigation is in progress. Allows the use of turf, even during irrigation.
- Longer system service life. Turbulent flow drippers and tubes are manufactured from high quality raw materials that guarantee a long service life.

When buried, the irrigation system is protected from damage caused by ultraviolet rays, fluctuations in temperature and damage due to crop tending.

- Substantial water savings. No losses through evaporation, deep percolation, surface run-off and de-localisation of moisture due to wind.
- Elimination of damage caused by machinery or vandalism. The absence of sprinkler heads, surface hoses or drip lines that may cause damage, or are susceptible to damage by vandalism, animals or from harvesting of the plot.
- Less salt. Less water also means less salt in the soil and groundwater.
- Lower maintenance costs. The system is permanently buried under the crops and requires no further handling or movement.
- Less use of pesticides. Fungicides and insecticides are not washed away with the irrigation water, and direct distribution through the system reduces waste.
- Reduced labour costs. Easier distribution of fertilisers, fewer weeds, disease control and lower maintenance all mean less labour is required.
- No obstacles during mechanised harvesting operations (harvesting, use of shakers, olive growing).
- Aesthetic improvement of the orchard as the tubes cannot be seen.

Installation

The **ROOTGUARD™** subirrigation system uses the same components as a traditional surface drip system, such as filtering, water treatment, the injection of fertilisers and pesticides, air venting and discharge valves, as well as both manual and automated control.

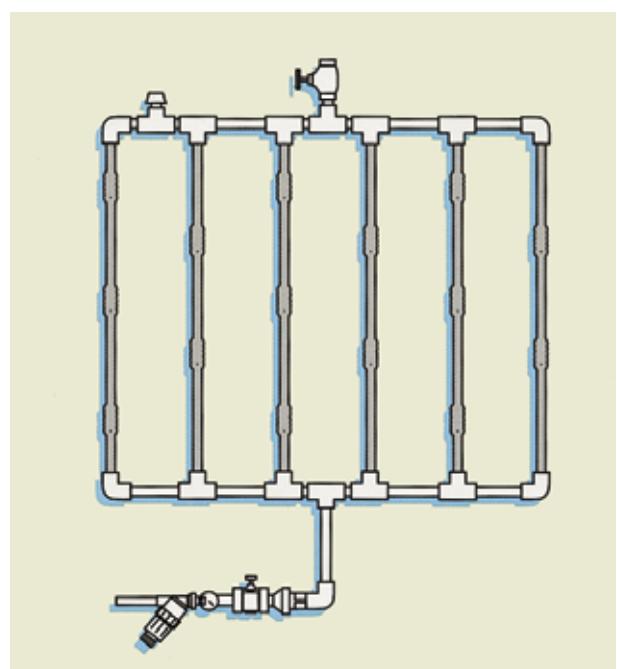

The only important and essential difference is the drip line produced with **ROOTGUARD™** technology.

Irritec® is able to supply **ROOTGUARD™** technology in combination with well-established drip line system, **MULTIBAR™**.

The hydraulic characteristics of the above-mentioned drippers are described in their respective technical catalogues.

Typical diagram of a subirrigation system

The installation manual and user manual for the **ROOTGUARD™** Subirrigation system are available upon request, and can also be downloaded from www.subirrigazione.it. In addition, our technical department can provide the necessary technical support for the design and installation of the **ROOTGUARD™** system.

On-line drippers | Pressure compensating turbulent flow dripper

iDrop®

The iDrop line® consists of on-line turbulent flow drippers which are suitable for orchards, vineyards, nurseries, greenhouses and all situations where a flow rate with minimum variations is required. The turbulent flow of the labyrinth makes the iDrop® line ideal for the prevention of clogging and requires very little maintenance, as a result. Functional quality, ease of installation in countless possible combinations and low costs are its main features.

IDROP® LIGHT / PC

iDrop® LIGHT / PC with pressure compensating turbulent flow which packs all of the iDrop® technology into a truly compact size. It features a double inlet filter and a durable silicone membrane. Available in version with Drop-Stop DS. iDrop® LIGHT / PC is Irritec's economical and versatile solution to meet the needs of farmers.

Field of application

IDROP® PC

iDrop® in its PC version, is available in both classic and Drop Stop versions. Pre-assembled together with the K-Drop System, it is the most advanced irrigate® proposal for soilless systems. IT IS particularly suitable for steeply sloping terrain and for crops with frequent fertigation cycles. It is the ideal solution for installations with long lines and on steep slopes. Two types of outlet are available: Standard and Multifunction

Field of application

IDROP® NORMAL

iDrop® is the on-line turbulent flow dripper suitable for orchards, vineyards, nurseries, greenhouses and all situations where a precise flow rate is required. The turbulent flow of the labyrinth makes it ideal for the prevention of clogging.

Dripper specifications

Flow rate LPH	Inlet Filter		Flow equation		Recommended filtration mesh		CV %	Hole coupling mm
LPH	Area mm²	x	k	mesh	%	mm		
2.1	2	0.46	0.76	120	≤ 3	2.5

On-line drippers | Pressure compensating turbulent flow dripper

iDrop® Light/PC

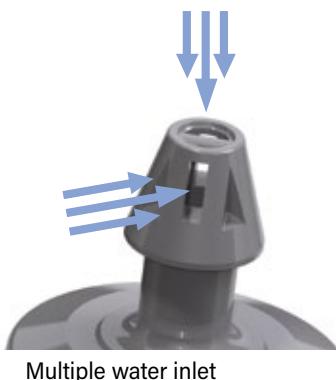

iDrop® in the LIGHT – PC version is the Irritec® on-line dripper with pressure compensating turbulent flow which packs all of its technology into a truly compact size. It has a double inlet filter, a tough silicone membrane and a turbulent labyrinth path that all contribute to its excellent hydraulic characteristics. Functional quality, ease of installation in countless possible combinations and low costs are its main features. iDrop Light was developed specifically for soilless use and is Irritec's economical and versatile answer to the needs of farmers.

Features and advantages

- Available with Drop Stop (ANTI-DRIP) system
- Ideal for greenhouses and nurseries and for all situations where maximum precision in water emission is required
- Turbulent flow to prevent sedimentation and clogging
- Multiple inlet filter: the dripper has a dual inlet system, one axial and the other lateral, which improves the flow of water to the unit
- Determination of the flow rate via the colour of the base of the outlet
- Multifunction outlet suitable for connection to micro tubes and manifolds

Multifunction Outlet

The new iDrop light - PC, with its multifunction outlet, allows the assembly of all Irritec manifolds, as well as Ø 6x4mm or Ø 5x3mm micro tubes as a result of its innovative multi-purpose outlet.

On-line drippers | Greenhouse Systems

K-drop System

K-Drop System is a pre-assembled kit consisting of iDrop drippers, cigar drippers and micro tubes, and is available in various diameters. Both practical and functional, it is available pre-assembled in standard dimensions, or modular form (by selecting manifold and stake) if dimensions other than those proposed in the price list are required. It is ideal for irrigating crops in greenhouses or in pots: the answer to the needs of soilless irrigation.

K-Drop System

EXAMPLE KIT	COMPONENTS REQUIRED	DESCRIPTION
 A		1 - iDrop or iDrop multifunction 2 - IMMC22000A032 3 - IMMC42000V032 4 - IMAST2000A000 5 - IMAST2000N000 6 - IMAST2000R000 capillary ø 3.2 mm ext.
 B		1 - iDrop or iDrop multifunction 2 - IMMO42000N030 3 - IMMO22000N030 4 - IMAID2015N026 micro tube PVC200 ø 5.5x3 mm.
 C		1 - IM7156000N050 2a - iDrop multifunction 2b - iDrop light 3 - IMASG2000N000 micro tube PE ø 6x4 mm.
 D		1a - iDrop 2a - IMMO12000N030 2b - IMML12000N030 3a - IMAIP2015N030 micro tubePE or PVC200 ø 6x4 mm. 1b - iDrop multifunction 2b - iDrop light 3b - IMAIP2015N030 micro tubePE or PVC200 ø 6x4 mm.

K-drop System

Recommended combinations with MC2-MC4 manifold

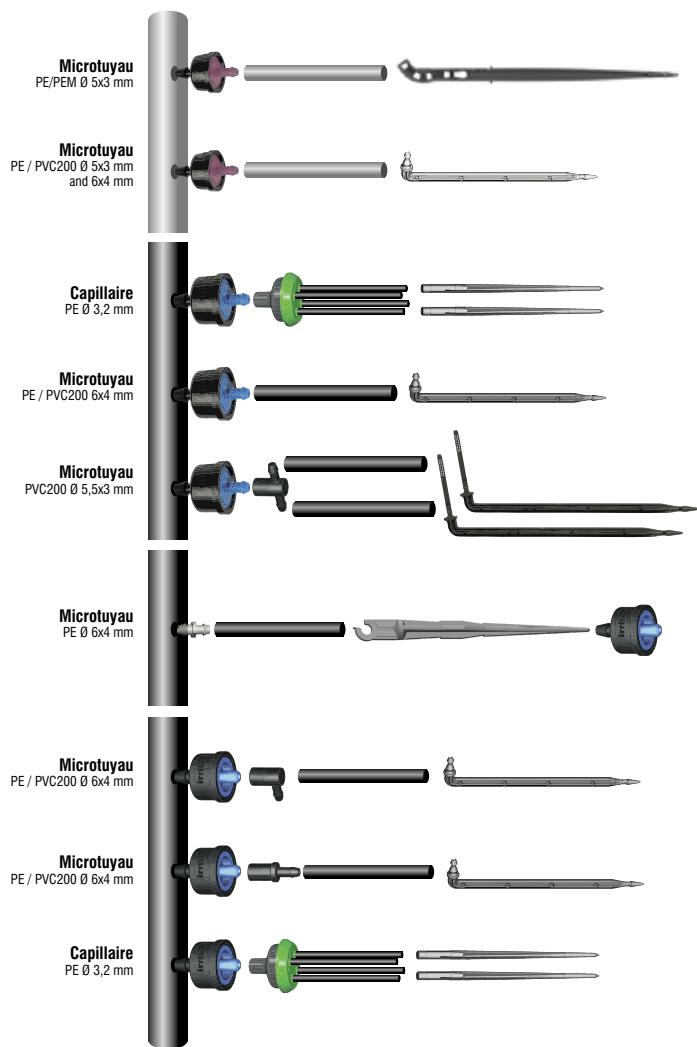

Flow rate per droplet point	Capillary Ø 3.2 mm X Ø int.								Manifold mod.	Idrop LPH
	L= 40 cm	L= 60 cm	L= 60 cm	L= 100 cm	0.8	1.0	1.2	1.5		
0.5 LPH			x		x		x		MC4	2.2
1.0 LPH	x	x	x		x		x		MC2	2.2
1.0 LPH		x	x		x		x		MC4	4.0
1.0 LPH	x		x		x		x		MC2	2.2
1.0 LPH			x		x		x		MC4	4.0
2.0 LPH	x	x	x	x	x	x	x		MC2	4.0
2.0 LPH			x		x		x		MC4	7.8
3.0 LPH	x	x	x	x	x	x	x		MC2	6.0
4.0 LPH		x		x	x		x		MC2	7.8

Recommended combinations with M02-M04 manifold

Flow rate per droplet point	No. of droplet points	Manifold mod.	Length of micro tube mm	Type of Stake	Idrop LPH
0.5 LPH	4	M04	50 - 80	ASD - AID	2.2
0.7 LPH	4	M04	50 - 80	ASD - AID	3.2
1.0 LPH	4	M04	50 - 80	ASD - AID	4.0
1.0 LPH	2	M02	50 - 80	ASD - AID	2.2
1.5 LPH	4	M04	50 - 80	ASD - AID	6.0
1.5 LPH	2	M02	50 - 80	ASD - AID	3.2
1.7 LPH	4	M04	50 - 80	ASD - AID	7.8
2.0 LPH	2	M02	50 - 80	ASD - AID	4.0

It is recommended not to exceed 10 cm difference in the level between droplet points.

COMBINATIONS Hole coupling ø 2.5 mm

Tubes and accessories

Tube in PE Ø 16 and 20 mm

Micro tube in PE
Ø 5x3 and 6x4 mm

Micro tube in PVC200
Ø 5.5x3 and 6x4 mm

On-line drippers | Capillary irrigation system

Capillar System™ +

THE CAPILLAR SYSTEM™ is the localised Irritec irrigation system, conceived for the nursery, flower-growing and greenhouse sector. The main feature of the system is the capillary, a micro tube with an internal diameter from 0.6 to 1.5 mm, manufactured by a process of coextrusion. Monitoring of quality, using laser equipment to check dimensional characteristics, allows accuracy to within a hundredth of a millimetre to be achieved.

What is it?

The system consists of a polyethylene tube and the capillary:

- The tube, available in diameters of 16 mm, 20 mm, and 25 mm, is perforated at the requested spacing;
- The capillary, with a diameter of 3.2 mm, is inserted in the tube and a stake is inserted into the end of the capillary, then placed in the soil in proximity to the plant.

How does it work?

The laminar flow generated by the extremely fine diameter of the capillary allows a constant flow rate to be achieved, relative to the length of the capillary and the operating pressure.

What are the advantages?

II CAPILLAR SYSTEM™ is a reliable and economical irrigation system:

- installation is carried out by laying the tube, supplied with the capillary pre-inserted, on the ground or crop bed and, using the stake, the capillary is then secured to the ground near the stem of the plant;
- for maintenance, or if the capillary is damaged, simply remove it from the tube and insert a new one;
- the flexibility of the system allows the emission points to be varied by modifying the length of the capillary.

Products

supplied by Irritec:

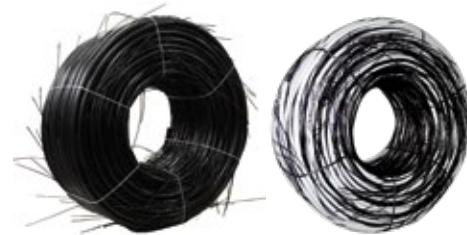

- complete, pre-assembled irrigation system consisting of the tube with capillary and stake (supplied separately);
- the tube can be perforated manually using the dedicated hole puncher or, on request, be pre-perforated at the desired spacing and for the diameter of the capillary to be inserted;
- three different stakes are available, to be affixed to the end of the capillary according to the type of use.

Flow rate tables of the capillaries based on the internal Ø, the length and the operating pressure

Field of application

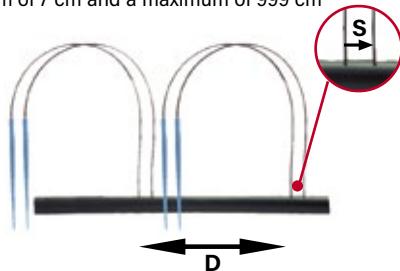

Insertion spacing

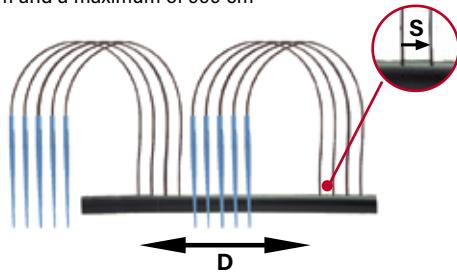

Single capillary insertion

the distance between the two capillaries (**S**) is a minimum of 7 cm and a maximum of 999 cm

Double capillary insertion

the distance between each pair of capillaries (**S**) is 2.5 cm, while the distance between pairs is a minimum of 9 cm and a maximum of 999 cm

Insertion of capillary in groups

the distance between each individual capillary (**S**) is a minimum of 7 cm and a maximum of 999 cm, while the distance between groups (**D**) is a minimum of 7 cm and a maximum of 999 cm

I-DRIP CARE

Biologically safe

- uses biocompatible substances
- prevents and resolves problems with scaling and biofilm formation
- prevents and solves problems related to bacteria, legionellosis and protozoa
- keeps systems efficient over time by improving their functionality

Products in the **I-DRIP CARE** line are compatible with the principles of the protocol on BIOSAFETY. Their formulations use active ingredients that are also used in the food industry, and which do not cause toxicity when in contact with cultivated lands or even with plants. They are non-toxic to humans, animals and the plants themselves. In some cases, they can become supporting and nourishing elements for the plants. They are therefore particularly suitable for use in organic farming where, by preventing the formation of biofilm and eliminating harmful bacteria such as Legionella, they fully comply with regulations concerning the protection of health and safety in the workplace (L:81/2008).

MAIN PROBLEMS WITH CLOGGING FOR CONVENTIONAL MICRO IRRIGATION SYSTEMS

- Clogging due to limescale
- Clogging due to the presence of iron and manganese
- Clogging caused by biofilms and organic matter

MAIN PROBLEMS WITH CLOGGING FOR MICRO IRRIGATION SYSTEMS IN GREENHOUSES

- Clogging due to limescale
- Clogging due to the presence of iron and manganese
- Clogging caused by biofilms and organic matter
- Hazard of exposing workers to toxic products in enclosed environments, as well as exposure to the risk of inhalation of water which may contain legionellosis

MAIN PROBLEMS WITH CLOGGING FOR ORGANIC FARMING MICRO IRRIGATION SYSTEMS

- Clogging due to limescale
- Clogging due to the presence of iron and manganese
- Clogging caused by biofilms and organic matter
- The use of incompatible substances (inorganic acids, chlorine and its derivatives, heavy metals, etc.) is prohibited.

Product	I-DROPCARE ACID	I-DROPCARE OXI
Prevents formation of limescale	OK	OK
Prevents deposits of Ca and Mg	OK	
Prevents deposits of Fe and Mn	OK	
Removal of deposits of Ca, Mg, Fe, Mn	OK	
Supplies the soil with phosphorous	OK	
Lowers pH level (for water with basic pH)	OK	
Prevents the formation of biofilm		OK

Product	I-DROPCARE ACID	I-DROPCARE OXI
Removes biofilm	OK	OK
Suitable for organic crops		OK
Suitable for greenhouse crops		OK
Continuous treatments	OK	OK
Seasonal treatments	OK	OK
